

What if it's not Parkinson's Disease?

According to The National Institute of Neurological Disorders and Stroke, experts estimate that as many as one million Americans are currently living with Parkinson's Disease.

For a small percentage of these people, however, this diagnosis doesn't seem right. Their medications may not appear to be effective. They may experience severe dizziness and even be prone to fainting. They just sense that the disease is progressing faster than expected. Those who feel like Parkinson's Disease is not it may in fact have multiple system atrophy (MSA).

About Mission MSA

Mission MSA, founded in 1989, is a 501(c)(3) charitable organization that is devoted to improving quality of life and building hope for people affected by multiple system atrophy through:

- Providing patients and care partners with trusted and compassionate emotional support.
- Educating patients, care partners, and healthcare professionals with credible, critically important, and relevant information.
- Building a sense of community by connecting and unifying people affected by MSA.
- Funding patient-centric collaborative research aimed at alleviating symptoms, slowing disease progression, and discovering a cure.
- Playing a leading role in raising awareness and advocating for those impacted by the disease.

Feel
Right

MISSION MSA®

What is MSA?

Multiple System Atrophy (MSA) is a rare disease that has similarities and features of Parkinsonism. Many physicians are unfamiliar with MSA and so often a diagnosis can be challenging.

As a result, a likely diagnosis of MSA might be delayed by years and even missed altogether.

Due to the variety of symptoms that could also be attributed to other conditions, diagnosing MSA can be challenging, even for the most experienced doctors.

Signs it May Not Be Parkinson's Disease

Look out for these telltale signs...

While Parkinson's disease tends to affect the parts of the brain that regulate movement, **MSA affects the autonomic nervous system.**

Those living with MSA may also develop **unique changes in their speech**, such as low or quivering voice.

Imbalance problems will manifest and progress **faster** among MSA patients.

The presence of sleep abnormalities is unique to MSA patients. These sleep abnormalities include:

- snoring
- sleep apnea
- stridor
- acting out dreams

MSA develops earlier than Parkinson's disease

Signs and symptoms in MSA patients occur between 55-60 years of age while Parkinson's typically emerges after 60.
